Create an online CV page to get your new IT career started. Make sure that it has the following features:

- It has at least the following pages (you may of course include the rest of the pages that you created before):
  - **"Home" / "About Me"** - add a photo of you, and a few words about yourself. Include the "front-end development" part
  - **"My Online CV"** - think about a format for your CV and start writing it in an HTML page. Describe the way
  - **"Show Off Page :D" / "Personal" / "Hobbies" / "Technical" / etc** - use this to show off some of the technical things that you've learned and are proud of (the BMI calculator, a Chuck Norris joke, the weather with or without geolocation, currency exchange, trivia game, anything nice that you've implemented and are proud of)
- It has a way of navigating between the pages (a menu present on all pages)
- It is **responsive**
  - Decide on an external library that you're using for this. Note: if possible, only use a grid, and style the rest yourself!
  - Define breakpoints

Process

- Define tasks for yourself
- Prioritize them
- Keep track of your work using those tasks

Generic Tasks (defined them together)

1. Get inspired by what others do
2. Define website structure
   a. Pages
   b. Navigation between them
   c. Common areas
      Q: how to have only one (html) file for the menu and load it in all three pages?
      A: [stack overflow for the win!](stack%20overflow%20for%20the%20win!)
3. Define & implement header & footer
4. Define HTML Content for all pages
5. Define breakpoints (at least for testing)
6. Style each page

Keep in mind:

- Keep it simple
- Aim to have a great usability
